ABSTRACT

The article presents a library management system composed of several surveillance cameras and a personal computer (PC). The system can secure a computer room against theft and detect fire in a stack room. Based on computer vision and database technology, this article proposes a library management system comprising several surveillance cameras, a PC, and software (written in C++). The system can continually capture and analyze images to determine whether people are present in the images. The system stores the analysis results in a database. These results are used for various applications. Computer vision technology can be used for safeguarding a library. There are many surveillance cameras in most university libraries, and the C++ language is popular. Thus, the system can be adopted in libraries for providing a safe environment. In technology, the system cannot be used to spy on what library materials library users are reading. This system helps librarians and increases the level of automated library

Search help

Exact match supported for author search results

You can perform an exact author search by enclosing the name (first and/or last) of the author in quotation marks.

Boolean operators

The Boolean operators AND, OR, and NOT can be applied to search terms.

AND (also + or &)

Use AND to search for documents containing two or more terms. For example, the following query returns documents containing both cat and dog:

cat AND dog

The AND operator is applied by default; for example cat AND dog produces the same results as cat dog.

OR

Use OR to search for documents containing at least one of two or more terms. For example, the following query returns documents containing cat, documents containing dog, and documents containing cat and dog:

cat OR dog
